WORK EXPERIENCE

IMC Logistics

Jul. 2019 – Present

Senior Software Developer | Apr. 2022 – Present

Memphis, TN

- Led the KTLO (Keep the Lights On) team, acting as first responder to production incidents and mentoring incoming developers through a structured ramp-up before transitioning them to specialized teams.
- Owned full-stack development of a mission-critical, real-time logistics dispatch platform (Postgres triggers, in-memory cache service, REST API, Angular UI) used by ~220 dispatchers daily, modernizing all four tiers over 3+ years from an untested, manually-deployed legacy stack into a fully CI/CD-automated, Kubernetes/GitOps-deployed system with gated dev/test/prod promotion.
- Architected a configurable notifications system allowing users to subscribe to location- and event-based alerts across 16 trigger types, including arrivals, dispatches, deliveries, document milestones, and geofencing events.

Software Developer | Jul. 2021 – Apr. 2022

- Acted as an early adopter and beta tester for GitLab CI/CD, Datadog APM/RUM, and Power BI reporting tools rolled out by other IT teams, while regularly collaborating with the Driver-facing IT team on shared initiatives.
- Built automation services eliminating manual workflows – including automated appointment scheduling, a document generation service removing the need for drivers to manually upload paperwork to get paid, and an EIR parsing service that auto-populated order data.

Contractor | Jul. 2019 – Jul. 2021

- Redesigned a legacy single-purpose feed parser into a generalized, config-driven equipment-pool ingestion platform, modernizing the codebase, adding multi-format support (delimited, XLSX, EDI) with ISO 6346 validation, and designing a diff-based sync engine – expanding partner coverage from 5 to 15 while improving data integrity and security posture.

FedEx

Jul. 2018 – Jun. 2019

Contractor

Memphis, TN

- Contributed to migrating Air Operations' vacation bidding application from Java Swing to Angular for mechanics across the FedEx Memphis airport hub – building reusable components, writing unit tests, and resolving bugs to ensure a smooth transition from the legacy desktop tool.

Optimal Learning Lab

Jan. 2016 – Apr. 2016

Software Developer

Memphis, TN

- Developed a Chart.js-based reporting module within a Meteor.js stack enabling instructors to visualize overall class and individual student performance over time, built and tested in a Vagrant-managed virtual environment emulating production conditions.

EDUCATION

The University of Memphis

May. 2017

B.S., Computer and Mathematical Sciences

Memphis, TN

SKILLS

- Java; TypeScript; JavaScript; C; SQL; HTML; CSS; Angular; Tailwind CSS; Bootstrap; Spring Boot; Kafka; REST APIs; Microservices; Node.js; JUnit; PostgreSQL; Kubernetes; OpenShift; GitLab CI/CD; Datadog; Nginx; Docker; Git; Postman; VisualVM
